Problem Definition and Background

Reiterate and expand on the problem definition. Provide background information and context.

Literature Review

Summarize 4 to 5 research papers related to your problem, detailing approaches and outcomes. How do these findings inform your project?

Methodology

Overview

Overview of Approach: Explain the overall approach, including key steps and goals. Are you using an experimental, theoretical, or data-driven approach? Describe why you chose this approach. Models and Algorithms: Briefly describe the specific models and algorithms you plan to use Describe why these models are suitable for your problem and how they align with your project's objectives. This subsection can brief, you will provide further detail in the next section Tools and Software: List the software, programming languages, or frameworks you intend to use (e.g., Python, R, TensorFlow, PyTorch, etc.). Describe why these tools are appropriate and any benefits they offer to your project. Implementation Strategy: Outline how you plan to implement the models and algorithms. Will you be coding from scratch, or using existing libraries and resources? Include information on data preprocessing, feature engineering, model training, validation, and testing. Evaluation Metrics: Describe how you will evaluate the success of your models. Discuss metrics such as accuracy, precision, recall, F1-score, etc. Provide justification for your chosen metrics and their relevance to the problem at hand.

Datasets and Models

Datasets

All data being used is open source. FEVER, Factily, Wikidata, and any other data sources are (currently) being considered as "true" - verified and trusted sources.

- **FEVER** – A large-scale dataset for fact-checking based on Wikipedia.
<https://fever.ai>
- **Factify** – A dataset and benchmark for factuality detection.
<https://github.com/surya1701/Factify-2.0>
- **Wikidata** – A collaboratively edited knowledge base from the Wikimedia Foundation.
<https://www.wikidata.org>
- **BERT** – A language model developed by Google AI.
<https://arxiv.org/abs/1810.04805>
- **T5** – A unified framework that casts all NLP tasks as text generation problems.
<https://arxiv.org/abs/1910.10683>

Models

Identify and describe the datasets and models being considered. **Description of Datasets:** Provide an overview of the datasets you plan to use, including the source, size, structure, and format. Discuss any preprocessing steps required to clean or transform the data, such as normalization, handling missing values, or encoding categorical variables. **Data Collection:** Describe how you will collect or source your datasets. Will you use public datasets, scrape data from websites, or collect it manually? Highlight any ethical or legal considerations for data collection, especially if it involves sensitive or personal information. **Data Splitting and Training:** Explain how you will split the data into training, validation, and test sets. Justify the proportions and rationale behind this choice. Describe any additional data augmentation or resampling techniques you plan to use. **Model Selection and Justification:** Detail the models or algorithms you will apply to the data, and explain why you chose them over other options. Mention any hyperparameters or specific settings you plan to explore for each model. **Potential Challenges and Mitigation:** Identify any potential challenges or risks associated with the datasets and models, such as class imbalance, overfitting, or underfitting. Discuss how you plan to mitigate these risks and ensure robust, reliable results.

Project Plan and Timeline

Provide a rough timeline and list the updated project components. Include soft deadlines for each significant phase.
